Trees based methods

Decision Trees, Random Forests and Gradient Boosting

Hicham Zmarrou, PhD

2018-11-12

Aims of this lesson

- ▶ Understand what are decision trees and random forests , how they works, and how to evaluate a DT or a RF model.

Aims of this lesson

- ▶ Understand what are decision trees and random forests , how they works, and how to evaluate a DT or a RF model.
- ▶ Decision tree is a type of supervised learning algorithm (having a pre-defined target variable) mostly used in classification problems.

Aims of this lesson

► Understand what are decision trees and random forests , how they works, and how to evaluate a DT or a RF model.

► Decision tree is a type of supervised learning algorithm (having a pre-defined target variable) mostly used in classification problems.

► It works for both categorical and continuous input and output variables.

Aims of this lesson

- ▶ Understand what are decision trees and random forests , how they works, and how to evaluate a DT or a RF model.
- ▶ Decision tree is a type of supervised learning algorithm (having a pre-defined target variable) mostly used in classification problems.
- ▶ It works for both categorical and continuous input and output variables.
- ▶ In this technique, we split the population or sample into two or more homogeneous sets (or sub-populations) based on most significant splitter/differentiator in input variables.
